Overview
The purpose of this document is to describe the guidelines AllWays Health Partners utilizes to determine medical appropriateness for the limited circumstances under which AllWays Health Partners authorizes coverage for enteral nutritional formulas and supplements. This document does not pertain to supplies related to enteral products. For supplies related to enteral products, please reference the DME Prior Authorization list. The treating provider must include information supporting the diagnosis, condition, and medical necessity in the request for prior authorization of enteral nutritional formulas and supplements.

Coverage Guidelines
AllWays Health Partners covers enteral nutrition formulas and supplements administered orally or via enteral tube when the member meets one of the conditions listed under the coverage criteria and when prescribed by the treating physician and in accordance with Massachusetts State Mandate.

AllWays Health Partners covers nutritional formulas and supplements
Medical necessity for nutritional formula or supplements administered orally or via enteral tube is established for members in the following situations:

1. Enteral nutrition, orally or by tube feeding, when used as a therapeutic regimen to prevent serious disability or death in a member with a medically diagnosed condition that precludes the full use of regular food or precludes adequate ingestion of calories to achieve sufficient growth.

2. Prematurity. Formulas formulated for premature infants may be covered for those infants born at less than or equal to 36 weeks gestation. The formulas may be covered for up to 3 months of age. Documentation required includes gestational age.

3. The member presents with clinical signs and symptoms of impaired digestion, malabsorption, or nutritional risk, as indicated by the following:
   a. The member cannot ingest regular food because of a medical condition; or
   b. Weight loss attributed to actual or potential developing malnutrition as defined below:
      • Adults and post-pubertal adolescents showing involuntary or acute weight loss of greater than or equal to 10 percent of usual body weight during a 3- to 6-month period, or body mass index below 18.5 kg/m²;

1 With consideration for measurement of BMI in members with chronic immobility for whom height is difficult to measure by using another anthropometric method such as height associated with arm span or ration of upper body to lower extremity length.
Neonates, infants, and children, showing:

a. Very low birth weight (VLBW <1500 g) within the first three months of life corrected for prematurity even in the absence of gastrointestinal, pulmonary, or cardiac disorders;

b. A sustained decrease in weight or weight-for-height-for-age-and-gender across two or more major percentiles after having previously established a stable rate of growth (growth velocity);

c. A lack of weight gain, or weight gain less than two standard deviations below the age-appropriate mean (i.e., below the 2nd percentile), and not growing at a rate parallel to the growth curve in a three-month period for children under six months, or four-month period for children aged six to 12 months, and that does not reverse with instruction in appropriate diet for age;

d. No weight gain, abnormally slow rate of gain for three months, for children older than one year, and/or documented weight loss that does not reverse promptly with instruction in appropriate diet for age; or

e. Weight or weight-for-height less than two standard deviations below the mean for age and gender (i.e. below the second percentile) and not growing at a rate parallel to the growth curve;

f. For individuals with genetic or other syndromes, where syndrome-specific growth charts are available, weight gain and growth are abnormally slow for the specific condition using the condition-specific growth chart;

g. Abnormal laboratory tests pertinent to the diagnosis.

4. The risk factors for actual or potential malnutrition have been identified and documented. Such risk factors include, but are not limited to, the following:

a. Anatomic structures of the gastrointestinal tract that prevents food from reaching the stomach (e.g. esophageal cancer), impair digestion and absorption;

b. Neurological disorders that impair swallowing or chewing;

c. Diagnosis of inborn errors of metabolism that require food products modified to be low in protein (for example, phenyketonuria (PKU), tyrosenemia, homocystinuria, maple syrup urine disease, propionic acidemia and methulmalonic acidemia);

d. Allergy to cow’s milk protein and soy infant formulas as manifested by one or more of the conditions listed in Table A that occurs while given a cow’s milk formula or breast milk with documented improvement from elimination of dairy from the diet and a successful trial of extensively hydrolyzed protein formula or, if such a trial failed, then a successful trial of amino-acid based formula. Each of the following must be present:

   a. Documented allergy to cow’s milk;

   b. Documented multiple protein intolerance;

   c. The primary source of nutrition being 100% hydrolyzed amino acids nutritional formula;

   e. Prolonged nutrient losses due to malabsorption syndromes or short-bowel syndrome, diabetes, celiac disease, chronic pancreatitis, renal dialysis, draining abscess or wounds;
f. Treatment with anti-nutrient or catabolic properties (for example, anti-tumor treatments, corticosteroids, immunosuppressants, etc.);
g. Increased metabolic and/or caloric needs due to excessive burns, infection, trauma, prolonged fever, hyperthyroidism, or illnesses that impair caloric intake and/or retention; or
h. A failure-to-thrive diagnosis that increases caloric needs while impairing caloric intake and/or retention.

5. Enteral nutrition is indicated as the primary source of nutritional support essential for the management of risk factors that impair digestion or malabsorption and for the management of surgical preparation or postoperative care.
6. For children older than one year of age, a retriial of commercial food and re-evaluation should demonstrate continued evidence of need for specialized formula.

**Coverage for State-Mandated Conditions**

a. Formulas for the treatment of inborn diseases of metabolism of amino acids and organic acids such as:
   - Phenylketonuria (PKU);
   - Tyrosinemia;
   - Homocystinuria;
   - Maple syrup urine disease;
   - Propionic acidemia or methylmalonic acidemia; or
   - Methylmalonic acidemia.

b. Nonprescription enteral formulas for home use for which a physician has written an order and which are medically necessary to help in the treatment of malabsorption caused by disorders affecting the absorptive surface, functional length, gastrointestinal tract motility, such as:
   - Crohn’s disease;
   - Ulcerative colitis;
   - Gastroesophageal reflux;
   - Gastrointestinal dysmotility; or
   - Chronic intestinal pseudo-obstruction.

c. Coverage for inborn diseases of amino acids and organic acids shall include food products modified to be low protein in an amount not to exceed $5,000 annually for any insured individual. **The $5,000 annual limitation only applies to low protein food products for Commercial Accounts.**

d. Under the State Mandate, formulas for the above conditions may be authorized for one year and require annual review for renewal.

**Exclusions**

AllWays Health Partners does not consider enteral products and nutrition supplements to be medically necessary under certain circumstances. Examples of such circumstances include, but are not limited to the following:
1. A medical history and physical examination have been performed and other possible alternatives have been identified to minimize nutritional risk.

2. The member is underweight but has the ability to meet nutritional needs through regular food consumption and/or commercially available caloric supplements.

3. Enteral products are used as supplements to a normal or regular diet in a member showing no clinical indicators of nutritional risk.

4. The member has food allergies, lactose intolerance, or dental problems, but has the ability to meet his or her nutritional requirements through alternative food sources.

5. Enteral products are used for dieting or a weight-loss program.

6. No medical history or physical examination has been taken and there is no documentation that supports the need for enteral nutrition products.

7. **(Commercial members)** AllWays Health Partners does not provide coverage for standard or commercial, non-hydrolyzed, non-elemental milk, or soy-based infant formulas as these are considered food and not to treat a medical condition.

8. AllWays Health Partners does not as a rule provide coverage for “standard infant formulas” or any formula offered by the Massachusetts WIC Nutrition Program in WIC eligible members. However, AllWays Health Partners may allow coverage if the request is for medically necessary quantities to sustain a healthy weight more than the quantity allowed by the WIC Program. Refer to the WIC Information for Providers page on Mass.gov (https://www.mass.gov/service-details/wic-information-for-providers) to find the standard infant formulas, as the standard infant formulas offered by the WIC Program may change brands.

9. Enteral nutrition and special medical formulas and foods are requested solely because of food preference in the absence of a medical condition.

10. Enteral nutrition products for premature infants older than three months of age. Standard infant formulas for home use (in a setting in which normal life activities take place) are expected to be used for premature infants older than three months of age (corrected for prematurity) and whose weight growth is parallel to or growing faster than the appropriate growth curve for age.

11. Growth parameters are consistent with specialized condition-specific growth charts for members with genetic conditions.

12. Children who are small but exhibit a normal growth rate parallel to the growth curve.

**Non-Covered Products**

1. Regular store-bought food for use with an enteral feeding system;

2. Food for the ketogenic diet;

3. Liquid nourishments and food products used for cleansing, detoxing, dieting or recommended by weight loss centers;

4. Nonprescription formulas, supplements, or prescription foods when store-bought food meets nutritional needs;

5. For MassHealth members, any formula that can be obtained through the WIC program (see MassHealth website for WIC formulas).

6. Human breast milk.
Documentation
The Provider is responsible for the following documentation:

1. The **MCO Combined Form for Enteral Products Authorization Requests**
2. A recent (within the past year) comprehensive medical history and physical examination and, if applicable, laboratory tests which have been conducted to detect factors contributing to nutrition risk.
3. Other evidence to support clinical criteria that may not be included in the MCO Combined Form for Enteral Products Authorization Request.
4. Requests for standard formulas in excess of what is provided by WIC requires documentation listing:
   a. Current formula intake;
   b. Growth parameters on the formula intake;
   c. The anticipated increase in formula needed to provide age appropriate growth.

Definitions

**Enteral Formula**: Liquid nourishment, which may be given through a feeding tube.

**Supplements**: Liquid nourishment which is taken by mouth and usually not associated with regular store or health store-bought food, such as instant breakfast drinks or protein powder drinks.

**Malabsorption**: A problem properly absorbing nutrition from food, potentially or actually leading to malnutrition.

**Malnutrition**: “A pathologic state of varying severity: its clinical features are caused by a deficiency, excess or imbalance of essential nutrients. The cause may be primary (involving the quantity or quality of food consumed) or secondary (involving alterations in nutrient requirements, utilization or excretion).” [ASPEN]

Combined Managed Care Organization (MCO) Medical Necessity Review Form for Enteral Nutrition Products (Special Formula): A standardized form completed by the prescriber for the purpose of establishing medical necessity for prior authorization.

<thead>
<tr>
<th>Diagnosis Or Symptoms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Severe atopic dermatitis in a child less than a year old</td>
<td>Must be diagnosed by an allergist or other appropriate specialist, and role of commercial formulas in causing the atopic dermatitis confirmed, such as by an immediate reaction after ingestion or improvement after a well-defined elimination diet. For children older than one year, a retrial of commercial food and any reevaluation should demonstrate continued evidence of food allergy.</td>
</tr>
</tbody>
</table>
| IgE-mediated cow’s milk protein allergy                    | 1. Characterized by one or more of the following symptoms related to the ingestion of cow’s milk protein:  
a. severe vomiting and abdominal pain within minutes to hours of food ingestion;  
b. severe diarrhea within six hours of food ingestion;  
c. pruritis or severe itching of the skin (localized or generalized);  
d. angioedema and urticaria;  
e. stridor, wheezing, or anaphylaxis.  
OR  
2. Characterized by a non-urticarial rash or with a rash and a negative IgE to soy. The child must fail trials of commercial formulas. For children older than a year, a retrial of commercial food and reevaluation should demonstrate evidence of food allergy. |
| Severe and persistent gastrointestinal irritability | 1. For infants up to six months of age, characterized by:
   a. weight loss or lack of weight gain;
   b. presence of significant vomiting or gastrointestinal bleeding;
   c. failure of trials of commercial formula; and
   d. recommended use of specialized formula by a gastrointestinal specialist.
   2. For infants from six to 12 months:
      a. demonstration that symptoms are significantly improved with the use of the requested special medical formula;
      b. a retrial of commercial formula is unsuccessful; and
      c. continuation of special formula use is recommended by a gastrointestinal specialist.
   3. For children older than one year of age, a retrial of commercial food and re-evaluation should demonstrate continued evidence of need for specialized formula. |
| Non-IgE mediated conditions | For children older than one year of age, a retrial of commercial food and reevaluation should demonstrate continued evidence of food allergy |
| Associated with cow’s milk allergy | 1. food protein-induced proctocolitis associated with blood streaked stools not caused by anal fissures, infection, or other common causes of bloody stools;
   2. pulmonary hemosiderosis;
   3. food protein-induced enterocolitis associated with malabsorption and failure to thrive;
   4. food protein-induced enteropathy associated with malabsorption, failure to thrive, diarrhea, and vomiting; and
   5. esophageal eosinophilia and/or eosinophilic gastroenteritis, associated with malabsorption and dysmotility. |
