| RELENZA (zanamivir) |
| TAMIFLU (oseltamivir) |
| XOFLUZA (baloxavir) |

**Status:** CVS Caremark Criteria  
**Type:** Post Limit Prior Authorization  
**Ref # 111-J**

*Drugs that are listed in the target drug box include both brand and generic and all dosage forms and strengths unless otherwise stated. OTC products are not included unless otherwise stated.

### FDA APPROVED INDICATIONS

**Relenza**

**Treatment of Influenza**
Relenza (zanamivir) inhalation powder is indicated for treatment of uncomplicated acute illness due to influenza A and B virus in adults and pediatric patients aged 7 years and older who have been symptomatic for no more than 2 days.

**Prophylaxis of Influenza**
Relenza is indicated for prophylaxis of influenza in adults and pediatric patients aged 5 years and older.

**Important Limitations on Use of Relenza**
- Relenza is not recommended for treatment or prophylaxis of influenza in individuals with underlying airways disease (such as asthma or chronic obstructive pulmonary disease) due to risk of serious bronchospasm.
- Relenza has not been proven effective for treatment of influenza in individuals with underlying airways disease.
- Relenza has not been proven effective for prophylaxis of influenza in the nursing home setting.
- Relenza is not a substitute for early influenza vaccination on an annual basis as recommended by the Centers for Disease Control's Immunization Practices Advisory Committee.
- Influenza viruses change over time. Emergence of resistance mutations could decrease drug effectiveness. Other factors (for example, changes in viral virulence) might also diminish clinical benefit of antiviral drugs. Prescribers should consider available information on influenza drug susceptibility patterns and treatment effects when deciding whether to use Relenza.
- There is no evidence for efficacy of zanamivir in any illness caused by agents other than influenza virus A and B. Patients should be advised that the use of Relenza for treatment of influenza has not been shown to reduce the risk of transmission of influenza to others.

**Compendial Uses**
Treatment of influenza A or B viral infection when administered after 48 hours in patients aged 7 years and older who are at higher risk for influenza complications or in patients aged 7 years and older with severe, complicated, or progressive illness4-10

**Tamiflu**

**Treatment of Influenza**
Tamiflu is indicated for the treatment of acute, uncomplicated illness due to influenza A and B infection in patients 2 weeks of age and older who have been symptomatic for no more than 48 hours.

**Prophylaxis of Influenza**
Tamiflu is indicated for the prophylaxis of influenza A and B in patients 1 year and older.

Limitations of Use
Tamiflu is not a substitute for early influenza vaccination on an annual basis as recommended by the Centers for Disease Control and Prevention Advisory Committee on Immunization Practices. Influenza viruses change over time. Emergence of resistance substitutions could decrease drug effectiveness. Other factors (for example, changes in viral virulence) might also diminish clinical benefit of antiviral drugs. Prescribers should consider available information on influenza drug susceptibility patterns and treatment effects when deciding whether to use Tamiflu.

Tamiflu is not recommended for patients with end-stage renal disease not undergoing dialysis.

Compndial Uses
Prophylaxis of influenza A or B viral infection in patients 3 months to 1 year of age if necessary after exposure to another person with influenza4-10
Treatment of influenza A or B viral infection when administered after 48 hours in patients who are at higher risk for influenza complications or in patients with severe, complicated, or progressive illness4-10

Xofluza
Xofluza is indicated for the treatment of acute uncomplicated influenza in patients 12 years of age and older who have been symptomatic for no more than 48 hours.

Limitations of Use
Influenza viruses change over time, and factors such as the virus type or subtype, emergence of resistance, or changes in viral virulence could diminish the clinical benefit of antiviral drugs. Consider available information on drug susceptibility patterns for circulating influenza virus strains when deciding whether to use Xofluza.

COVERAGE CRITERIA
The requested drug will be covered with prior authorization when the following criteria are met:
- The request is for Xofluza (baloxavir) for a patient 12 years of age or older who has acute uncomplicated influenza
  OR
- The requested drug, i.e., Tamiflu or Relenza, is being prescribed for the prophylaxis (prevention) or the treatment of influenza A or B viral infection
  OR
- The request is for Tamiflu (oseltamivir) for the prophylaxis of influenza A or B viral infection in a patient 3 months of age or older who has been exposed to a community outbreak
  OR
- The request is for Relenza (zanamivir) for the prophylaxis of influenza A or B viral infection in a patient 5 years of age or older who has been exposed to a community outbreak

Quantity Limits apply.

RATIONALE
The intent of the criteria is to provide coverage consistent with product labeling, FDA guidance, standards of medical practice, evidence-based drug information, and/or published guidelines. Relenza (zanamivir) inhalation powder is indicated for treatment of uncomplicated acute illness due to influenza A and B virus in adults and pediatric patients aged 7 years and older who have been symptomatic for no more than 2 days. Relenza is indicated for prophylaxis of influenza in adults and pediatric patients aged 5 years and older. Tamiflu (oseltamivir) is indicated for the treatment of acute, uncomplicated illness due to influenza A and B infection in patients 2 weeks of age and older who have been symptomatic for no more than 48 hours. Tamiflu is indicated for the prophylaxis of influenza A and B in patients 1 year and older. Xofluza (baloxavir) is indicated for the treatment of acute uncomplicated influenza in patients 12 years of age and older who have been symptomatic for no more than 48 hours.

Relenza is not recommended for treatment or prophylaxis of influenza in individuals with underlying airways disease (such as asthma or chronic obstructive pulmonary disease) due to risk of serious bronchospasm. Relenza has not been proven effective for treatment of influenza in individuals with underlying airways disease. Relenza has not been proven effective
for prophylaxis of influenza in the nursing home setting. Relenza is not a substitute for early influenza vaccination on an annual basis as recommended by the Centers for Disease Control's Immunization Practices Advisory Committee. Influenza viruses change over time. Emergence of resistance mutations could decrease drug effectiveness. Other factors (for example, changes in viral virulence) might also diminish clinical benefit of antiviral drugs. Prescribers should consider available information on influenza drug susceptibility patterns and treatment effects when deciding whether to use Relenza. There is no evidence for efficacy of zanamivir in any illness caused by agents other than influenza virus A and B. Patients should be advised that the use of Relenza for treatment of influenza has not been shown to reduce the risk of transmission of influenza to others.

Tamiflu is not a substitute for early influenza vaccination on an annual basis as recommended by the Centers for Disease Control and Prevention Advisory Committee on Immunization Practices. Influenza viruses change over time. Emergence of resistance substitutions could decrease drug effectiveness. Other factors (for example, changes in viral virulence) might also diminish clinical benefit of antiviral drugs. Prescribers should consider available information on influenza drug susceptibility patterns and treatment effects when deciding whether to use Tamiflu.

Influenza viruses change over time, and factors such as the virus type or subtype, emergence of resistance, or changes in viral virulence could diminish the clinical benefit of antiviral drugs. Consider available information on drug susceptibility patterns for circulating influenza virus strains when deciding whether to use Xofluza.

The initial limits for Relenza and Tamiflu are based on the Center for Disease Control and Prevention (CDC) recommendation to allow a quantity to accommodate at least 2 weeks of community setting prophylaxis, at least 14 doses, up to 20 doses (due to packaging), once every 90 days. The limits for Relenza and Tamiflu are also based on the recommended dosing regimen for the treatment or household prevention of influenza, providing quantity sufficient for 5 days of treatment or 10 days of household prevention, twice every 90 days [10 doses each course for 2 courses, for a total of 40 blisters of Relenza, 20 capsules of Tamiflu 75mg or 45 mg, 40 capsules of Tamiflu 30mg (two capsules for 60mg dosing), or 6 bottles of Tamiflu suspension]. The limits for Xofluza are based on the recommended dosing regimen for the treatment of influenza providing quantity sufficient for 1 day of treatment, twice every 90 days (1 dose each course for 2 courses, for a total of 4 tablets).

*These drugs are for short-term acute use; therefore the 3 month limit will be the same as the 1 month limit.

The post limit quantities for Relenza and Tamiflu are based on the recommended dosing regimen for extended community setting prophylaxis use for illnesses caused by influenza A and B virus. The post limit quantity for approval may cover 1 month of Relenza or 6 to 12 weeks of Tamiflu for extended community setting prophylaxis, per 3 months. The post limit quantity may cover for another course of therapy as 10 doses for Tamiflu or Relenza, or for another treatment course of therapy as 1 dose for Xofluza, per 3 months, [20 blisters of Relenza, 10 capsules of Tamiflu 75mg or 45 mg, 20 capsules of Tamiflu 30mg (30mg or 60mg dosing), 3 bottles of Tamiflu suspension, or 2 tablets of Xofluza.]

The CDC states that influenza activity often begins to increase in October. Most of the time flu activity peaks between December and February, although activity can last as late as May.4-10 When indicated, antiviral treatment should be started as soon as possible after illness onset, ideally within 48 hours of symptom onset.4,7 The CDC states that antiviral treatment might have some benefits in patients with severe, complicated or progressive illness, and in patients at higher risk for influenza complications when started after 48 hours of illness onset.4-9
The CDC does not recommend widespread or routine use of antiviral medications for chemoprophylaxis so as to limit the possibilities that antiviral resistant viruses could emerge. To be effective as chemoprophylaxis, an antiviral medication must be taken each day for the duration of potential exposure to a person with influenza and continued for 7 days after the last known exposure. For persons taking antiviral chemoprophylaxis after inactivated influenza vaccination, the recommended duration is until immunity after vaccination develops (antibody development after vaccination takes about two weeks in adults and can take longer in children depending on age and vaccination history). For control of outbreaks in institutional settings (e.g. long-term care facilities for elderly persons and children) and hospitals, CDC recommends antiviral chemoprophylaxis for a minimum of 2 weeks, and continuing up to 1 week after the last known case was identified.6,7

Relenza (zanamivir)
Prophylaxis – Community Setting
The recommended dose of Relenza for prophylaxis of influenza in adults and adolescents in a community setting is 10mg once daily for 28 days. There are no data on the effectiveness of prophylaxis with Relenza in a community outbreak when initiated more than 5 days after the outbreak was identified in the community. The safety and effectiveness of prophylaxis with Relenza have not been evaluated for longer than 28 days’ duration.

The Relenza 10-mg dose is provided by 2 inhalations (one 5-mg blister per inhalation). Relenza is supplied in five Rotadisks each containing 4 blisters of the drug (20 blisters), packaged in a carton with 1 Diskhaler inhalation device.

Each dose of Relenza is provided by 2 inhalations which is 2 blisters. Therefore, the community outbreak prophylaxis limit will be 60 blisters which allows for 30 doses (due to packaging) of 2 inhalations per dose accommodating a 28 day course of therapy.

Treatment and Prophylaxis - Household
The recommended dose of Relenza for treatment of influenza in adults and pediatric patients aged 7 years and older is 10mg twice daily for 5 days. The recommended dose of Relenza for prophylaxis of influenza in adults and pediatric patients aged 5 years and older in a household setting is 10mg once daily for 10 days.

Therefore, the treatment or household prophylaxis limit will be 20 blisters which allows for 1 course of therapy of 10 doses of 2 inhalations per dose.

Oseltamivir (Tamiflu)
Prophylaxis – Community Setting
The recommended dosage of Tamiflu for prophylaxis of influenza in adults and adolescents 13 years and older is 75mg (one 75mg capsule or 12.5mL of oral suspension) orally once daily for up to 6 weeks during a community outbreak. In immunocompromised patients, Tamiflu may be continued for up to 12 weeks.

Prophylaxis in pediatric patients is recommended up to 6 weeks during a community outbreak. The recommended oral dosage of Tamiflu for prophylaxis of influenza in pediatric patients 1 year to 12 years of age is based on body weight, see table. Although not part of the FDA- approved indications, use of oral oseltamivir (Tamiflu) for chemoprophylaxis in infants 3 months to 1 year of age if necessary is recommended by the CDC and the American Academy of Pediatrics.4-10

Tamiflu capsules are available in 30mg, 45mg, and 75mg strengths in blister packs of 10. Tamiflu is also available as oral suspension for constitution delivering 360mg/60mL (6mg/mL). Constituted oral suspension can be stored under refrigeration for up to 17 days or for up to 10 days at controlled room temperature.

Each dose of Tamiflu is provided by 1 to 2 capsules or up to 12.5mL oral suspension based on body weight. Therefore, the community outbreak prophylaxis limit will be 42 capsules of 45mg or 75mg, 84 capsules of 30mg (two capsules for 60mg dose), or 540mL of oral suspension, which allows for 42 doses, per 3 months. For immunocompromised patients the community outbreak prophylaxis limit will be 84 capsules of 45mg or 75mg, or 168 capsules of 30mg (two capsules for 60mg dose), or 1080mL of oral suspension, which allows for 84 doses.

Treatment
The recommended oral dosage of Tamiflu for treatment of influenza in adults and adolescents 13 years and older is 75mg (one 75mg capsule or 12.5mL of oral suspension) twice daily for 5 days. The recommended oral dosage of Tamiflu for treatment of influenza in pediatric patients 2 weeks of age through 12 years of age is based on body weight, see table. Although not part of the FDA-approved indications, use of oral oseltamivir (Tamiflu) for treatment in infants less than 2 weeks of age if necessary is recommended by the CDC and the American Academy of Pediatrics.4-10

Prophylaxis - Household
The recommended dosage of Tamiflu for prophylaxis of influenza in adults and adolescents 13 years and older is 75mg (one 75mg capsule or 12.5mL of oral suspension) orally once daily for at least 10 days following close contact with an infected individual. Prophylaxis in pediatric patients is recommended for 10 days following close contact with an infected individual. The recommended oral dosage of Tamiflu for prophylaxis of influenza in pediatric patients 1 year to 12 years of age is based on body weight, see table. Although not part of the FDA-approved indications, use of oral oseltamivir (Tamiflu) for chemoprophylaxis in infants 3 months to 1 year of age if necessary is recommended by the CDC and the American Academy of Pediatrics.4-10

Therefore, the treatment or household prophylaxis limit will be 10 capsules of 45mg or 75mg, 20 capsules of 30mg (two capsules for 60mg dose), or 180mL of oral suspension which allows for 1 course of therapy of 10 doses.

Xofluza (baloxavir marboxil)
Initiate treatment with Xofluza within 48 hours of influenza symptom onset. Xofluza is taken orally as a single dose. The recommended dose of Xofluza in patients 12 years of age or older with acute uncomplicated influenza is a single weight-based dose as follows:

<table>
<thead>
<tr>
<th>Patient Body Weight (kg)</th>
<th>Recommended Oral Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>40 kg to less than 80 kg</td>
<td>Single Dose of 40 mg</td>
</tr>
<tr>
<td>At least 80 kg</td>
<td>Single Dose of 80 mg*</td>
</tr>
</tbody>
</table>

*Two 40mg tablets should be used for the 80mg dose.

Xofluza is available as 2 x 20mg tablets per blister card, and 2 x 40 mg tablets per blister card.

Each dose of Xofluza is provided by 2 tablets based on body weight. Therefore, the limit will be 2 tablets of 20mg or 40mg, which allows for 1 course of therapy of 1 dose.

These drugs are for short-term acute use; therefore, the duration of approval will be 3 months.

REFERENCES

CRITERIA FOR APPROVAL

1. Is this request for Xofluza (baloxavir)?
   [If no, then skip to question 3.]
   Yes No

2. Is this request for a patient 12 years of age or older who has acute uncomplicated influenza?
   [If yes, then skip to question 10.]
   [If no, then no further questions.]
   Yes No

3. Is the requested drug being prescribed for the prophylaxis (prevention) or the treatment of influenza A or B viral infection?
   Yes No

4. Is this request for oseltamivir (Tamiflu) for prophylaxis in a patient 3 months of age or older who has been exposed to a community outbreak?
   [If no, then skip to question 8.]
   Yes No

5. Does the patient require more than the following quantities for 6 weeks: A) 42 capsules of 75mg or 45mg, B) 84 capsules of 30mg, C) 540mL/9 bottles of suspension?
   [If no, then no further questions.]
   Yes No

6. Is this request for a patient with immune deficiencies?
   [If no, then no further questions.]
   Yes No
7 Does the patient require more than the following quantities for 12 weeks: A) 84 capsules of 75mg or 45mg, B) 168 capsules of 30mg, C) 1080mL/18 bottles of suspension? [No further questions.]

[Note: If no, then deny and enter a partial approval for 3 months for an additional quantity of Tamiflu (oseltamivir): 42 capsules of 75mg, or 42 capsules of 45mg, or 84 capsules of 30mg, or 540mL of suspension.]

8 Is this request for Relenza (zanamivir) for prophylaxis in a patient 5 years of age or older who has been exposed to a community outbreak? [If no, then skip to question 10.]

9 Does the patient require more than 60 blisters (30 doses)? [No further questions.]

[Note: If yes, then deny and enter a partial approval for 3 months for an additional quantity of 60 blisters of Relenza (zanamivir).]

10 Is this request for more than any of the following for this course of therapy: A) Tamiflu (oseltamivir): 10 capsules of 75mg or 45mg; 20 capsules of 30mg; 180mL/3 bottles of suspension, B) Relenza (zanamivir): 20 blisters, C) Xofluza (baloxavir): 2 tablets of 20mg or 40mg?

[Note: If yes, then deny and enter a partial approval for 3 months for an additional quantity of Tamiflu (oseltamivir) 10 capsules of 75mg, or 10 capsules of 45mg, or 20 capsules of 30mg, or 180mL of suspension; OR 20 blisters of Relenza (zanamivir); OR Xofluza (baloxavir) 2 tablets of 20mg or 2 tablets of 40mg.]
