### Overview

Osimertinib is an irreversible epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor which binds to select mutant forms of EGFR, including T790M, L858R, and exon 19 deletion at lower concentrations than wild-type. Osimertinib exhibits less activity against wild-type EGFR (as compared to other EGFR inhibitors) and is selective for sensitizing mutations and the T790M resistance mutation, which is the most common mechanism of resistance to EGFR tyrosine kinase inhibitors

### Coverage Guidelines

Authorization will be granted if the member is currently using Tagrisso, except when the product is obtained as samples or via manufacturer’s patient assistance programs.

**OR**

Authorization will be granted when all the following criteria has been met, and documentation has been submitted:

1. The member is diagnosed with advanced or metastatic NSCLC
2. The prescriber is an oncologist
3. The cancer displays EGFR exon 19 deletions or exon 21 L858R mutations

**OR**

4. The cancer displays the EGFR mutation and the T790M resistance mutation **AND**
5. The member has had an inadequate response or adverse reaction to one or contraindication to all the following agents:
  - Erlotinib
  - Gilotrif (afatinib)
  - Iressa (gefitinib)

### **Limitations**

1. Approvals will be granted for 12 months
